

IMPROVED QUALITY OF SERVICE FOR NETWORK CONNECTED CLIENTS

ABSTRACT

5 A network server for communicating with a network client over a network comprising: a client configuration detector for detecting a configuration of the network client; a server configurator for changing the configuration of the network server; a comparator for determining if the configuration of the network client is compatible with the configuration of the network server;
10 and a server communications component for connecting with the network client using a connection-oriented protocol, wherein the server communications component is operable to disconnect the network client responsive to said comparator.
